

(a) Approaching success

15-frame cyclist; growth +21.98, $dx_norm = -0.15$
true = approaching pred = approaching

(b) Crossing R→L success

11-frame pedestrian; large dx_norm , low growth
true = crossing_right_to_left pred = crossing_right_to_left

(c) Moving-away success

17-frame pedestrian; $r < 0$, shrinking bbox
true = moving_away pred = moving_away

(d) Conservative abstention (static)

1-frame parked-bicycle detection → uncertain
true = static pred = uncertain
